Criterion	Java world	CYBOP world
Language	Java	CYBOL (XML-based)
Interpreter	Java Virtual Machine (JVM)	CYBOI (written in C)
Theory	Object Oriented Programming (OOP)	CYBOP (knowledge schema)

Java Class

```
public class Dialogue {  
  
    // Structural attributes  
  
    private String title;  
    private Toolbar toolbar;  
    private Button button;  
  
    // Additional properties  
  
    private Point position;  
    private Dimension size;  
    private Color background;  
  
    // Methods  
  
    public void initialise(Object o);  
    public void process(Event e);  
}
```

Parts make up a whole

Properties:
position, size, colour, order

Constraints:
minimum, maximum, choice

State Template "dialogue.cybol"

```
<model>
  <part name="title" channel="inline" format="character" model="Test"/>
  <part name="toolbar" channel="file" format="element/part" model="path/file.cybol"/>
  <part name="button" channel="file" format="element/part" model="path/button.cybol">
    <property name="position" channel="inline" format="number/integer" model="5,5"/>
    <property name="size" channel="inline" format="number/integer" model="600,400"/>
    <property name="background" channel="inline" format="colour/terminal" model="red"/>
  </part>
</model>
```

Logic Template "initialise.cybol"

```
<model>
  <part name="build_menu" channel="inline" format="path/knowledge" model=".logic.menu"/>
  <part name="build_panel" channel="inline" format="path/knowledge" model=".logic.panel"/>
  <part name="display" channel="inline" format="communicate/send" model="">
    <property name="channel" channel="inline" format="meta/channel" model="terminal"/>
    <property name="encoding" channel="inline" format="meta/encoding" model="utf-8"/>
    <property name="language" channel="inline" format="meta/language" model="message/tui"/>
    <property name="format" channel="inline" format="meta/format" model="element/part"/>
    <property name="message" channel="inline" format="path/knowledge" model=".dialogue"/>
    <property name="clear" channel="inline" format="logicvalue/boolean" model="true"/>
  </part>
</model>
```

Unidirectional relations

Traditional

Programme Structure

Runtime Structure

CYBOP

CYBOL Possibilities

scripting language including knowledge tree

easy communication using send/receive and tui/gui/wui

usable by non-programmers

just one software pattern: hierarchy

New developers welcome!

<http://www.cybop.org/>

Addendum

Inter-Disciplinary Ideas

Philosophy: Body & Mind = active system & passive data

Biology: Cell & DNA = system & application knowledge

Psychology: Thinking = item + category + compound

Physics: Space & Time = state-structure & logic-workflow

Solved Problems

falsified container content due to container inheritance
fragile base class problem due to polymorphism
untraceable data manipulation due to global data access
circular references due to bidirectional dependencies
bidirectional dependencies due to reflective architectures
strong coupling due to bundling of attributes and methods
difficult maintenance due to high complexity

Characteristics

- long-life software system due to strict separation of application knowledge and system software
- less dependencies due to representation of structural- and meta data in form of a double hierarchy
- flexible architecture due to unified schema as the only remaining static memory structure
- clean knowledge model code due to tree structure with unidirectional relations
- universal communication due to star-like (not layer-like) translation architecture
- easy handling due to one syntax describing states (space) and algorithms (time) in the same way
- superfluous implementation phase due to direct interpretation of knowledge

Traditional

models suffer from
complexity
strong coupling /
dependencies
inflexible
difficult to maintain

CYBOP

one schema as memory
structure
directed acyclic graph (tree)
easily extensible
long-life software system
