

CYBOP

the future of programming

characteristics

long-life software system due to strict separation of application knowledge and system software
less dependencies due to representation of structural- and meta data in form of a double hierarchy
flexible architecture due to unified schema as the only remaining static memory structure
clean knowledge model code due to tree structure with unidirectional relations
universal communication due to star-like (not layer-like) translation architecture
easy handling due to one syntax describing states (space) and algorithms (time) in the same way
superfluous implementation phase due to direct interpretation of knowledge

solved problems

falsified container content due to container inheritance
fragile base class problem due to polymorphism
untraceable data manipulation due to global data access
circular references due to bidirectional dependencies
bidirectional dependencies due to reflective meta architectures
strong coupling due to bundling of attributes and methods
difficult maintenance due to high complexity

although cybop is free / open source software (GPL), it may well be used for commercial applications, since enterprise knowledge remains private

cybop is not in research for very much longer – discover its potential !

Cybernetics Oriented Programming (CYBOP)

I will be glad to present CYBOP to you or your company.
Do not hesitate to contact me at: <christian.heller@tuxtax.de>

Experience

Structural / Procedural / Object Oriented / Component Based Programming
Software Architectures and -Patterns (Gamma, Buschmann, Fowler et al.)
Unified Modeling Language (UML) and tools (OTW, Rose, Innovator, TogetherJ)
C (glibc, libxml, pthread, UNIX / TCP socket, Linux console, xlibs/X11)
C++ (MFC, Stingray, Visual C++; currently strong interest in Qt)
Java (AWT / Swing, J2EE, EJB, JSP, JBuilder, Visual Age / Eclipse)
Delphi / Object Pascal, COM, ADO, DAO, Access DB etc.
Markup Languages (XML, HTML, LaTeX)
Debian / SuSE GNU/Linux, KDE / GNOME, alle Windows-Varianten

About us

Tux Tax is a one-man enterprise in whose name I act as freelance software expert. My focus is on software architecture and -development. Main emphasis of my work is the area of business analysis and domain model design using the Unified Modeling Language (UML), software patterns and frameworks. I have experience in the creation of persistence layers for mapping relational data (ERM) of a database or legacy system into object-oriented (OO) models. Also, I have knowledge in the connexion of graphical, textual and web user interfaces (UI). It will be a pleasure for me to receive your service request and to convince you of the quality of my architectural and development capabilities.
